Introduction

- SpaceWire provides a unified high-speed data-handling network for connecting together
 - Sensors,
 - Processing elements,
 - Mass-memory units,
 - Downlink telemetry sub-systems,
 - EGSE

Space
Technology
Centre
University of Dundee

Introduction

- SpaceWire a standard for spacecraft onboard data-handling
 - ESA ECSS-E-50-12A
- Based on two commercial standards
 - IEEE-1355 with bugs fixed
 - LVDS (Low Voltage Differential Signalling)
- SpaceWire is the result of work by many people across the world

Standard

- The SpaceWire standard covers the following normative protocol levels
 - Physical Level: Connectors, cable assemblies and PCB tracks
 - Signal Level: Data-Strobe signal encoding, voltage-levels, noise margins, and data rates
 - Character Level: Data and control characters used to manage the flow of data across a link
 - Exchange Level: Protocol for link initialisation, flow control, link error detection and link error recovery
 - Packet Level: How data is split up into packets for transfer across a SpaceWire link
 - Network Level: Structure of a SpaceWire network, transfer of packets across a network, handling of errors

Space
Technology
Centre
University of Dundee

Physical Level

- Cables
- Connectors
- Cable Assemblies
- PCB Traces

Cable Construction

Cable Assembly

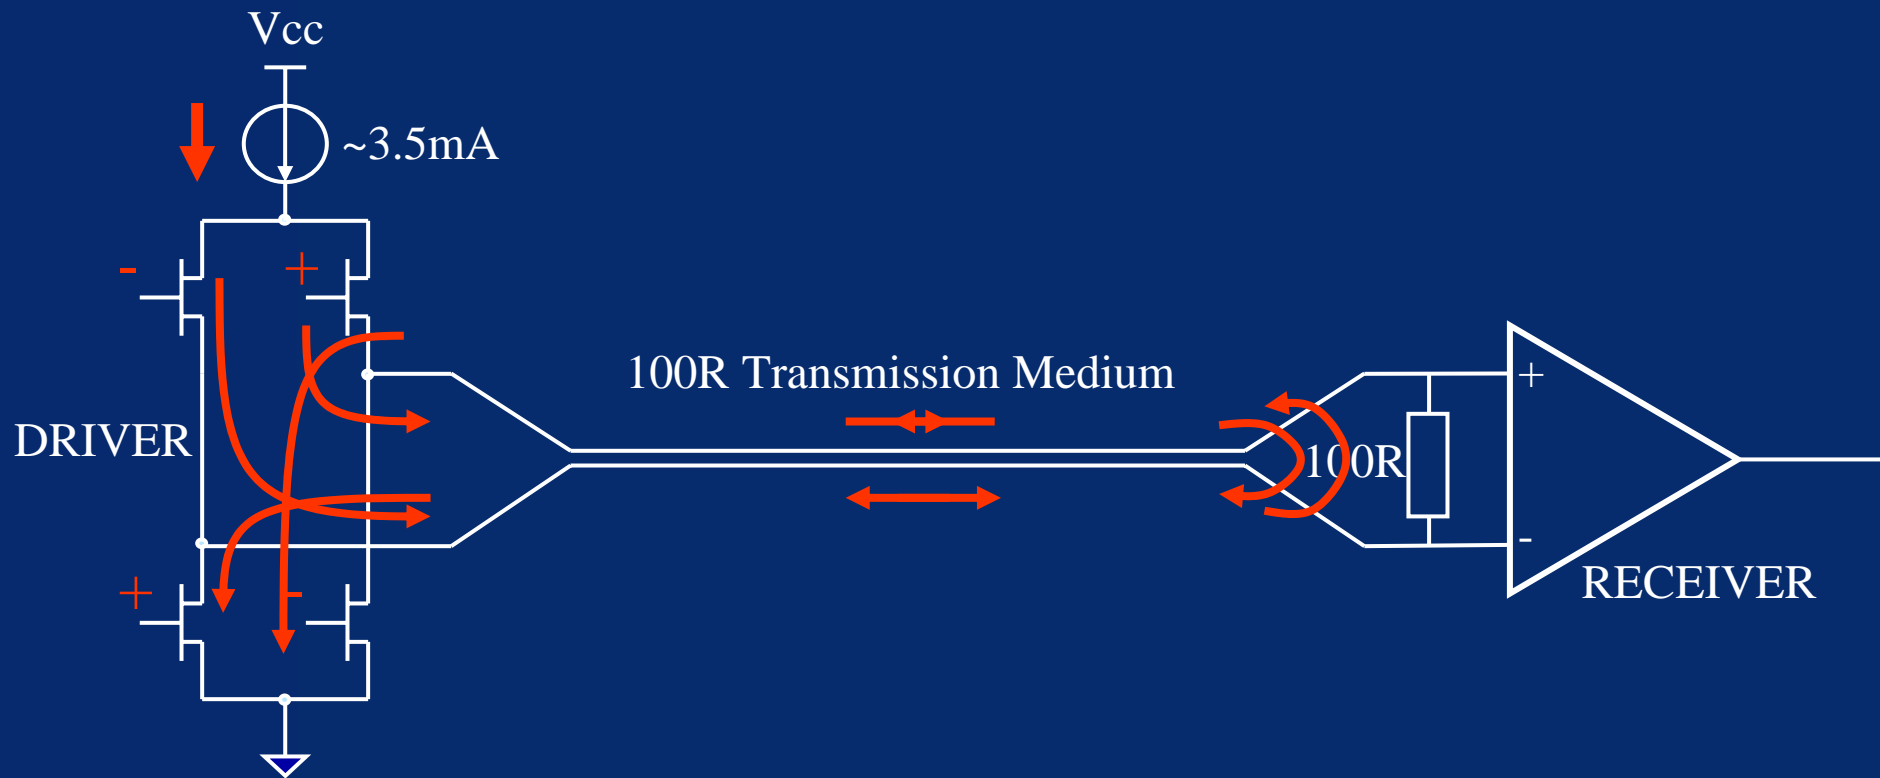

Space
Technology
Centre
University of Dundee

Signal Level

- Low Voltage Differential Signalling (LVDS)
- Signal Encoding - Data/Strobe Encoding

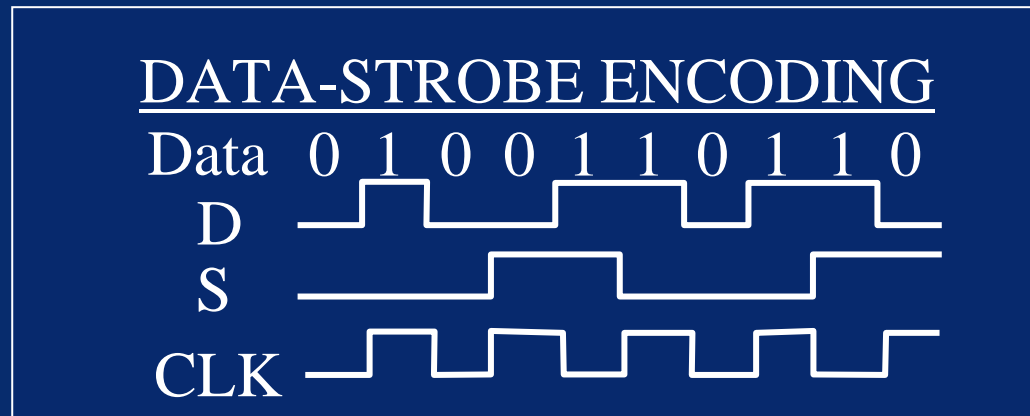

LVDS Driver and Receiver

Data Encoding

- SpaceWire uses Data-Strobe (DS) encoding
 - Data values transmitted directly
 - Clock encoded with data to form strobe
 - XORing data and strobe recovers clock
 - Provides improved jitter/skew tolerance compared to data clock encoding

- D and S transmitted differentially using LVDS

Space
Technology
Centre
University of Dundee

Data Signalling Rate

- Minimum data signalling rate
 - 2 Mbits/s
- Maximum data signalling rate
 - Depends on skew/jitter and attenuation
 - $\gg 100$ Mbits/s
- Operational data signalling rate
 - Any rate 2 Mbits/s to maximum
 - Rx and Tx can operate at different rates
 - Tx rate may be altered at any time after link connection made
- Initial data signalling rate 10 ± 1 Mbits/s

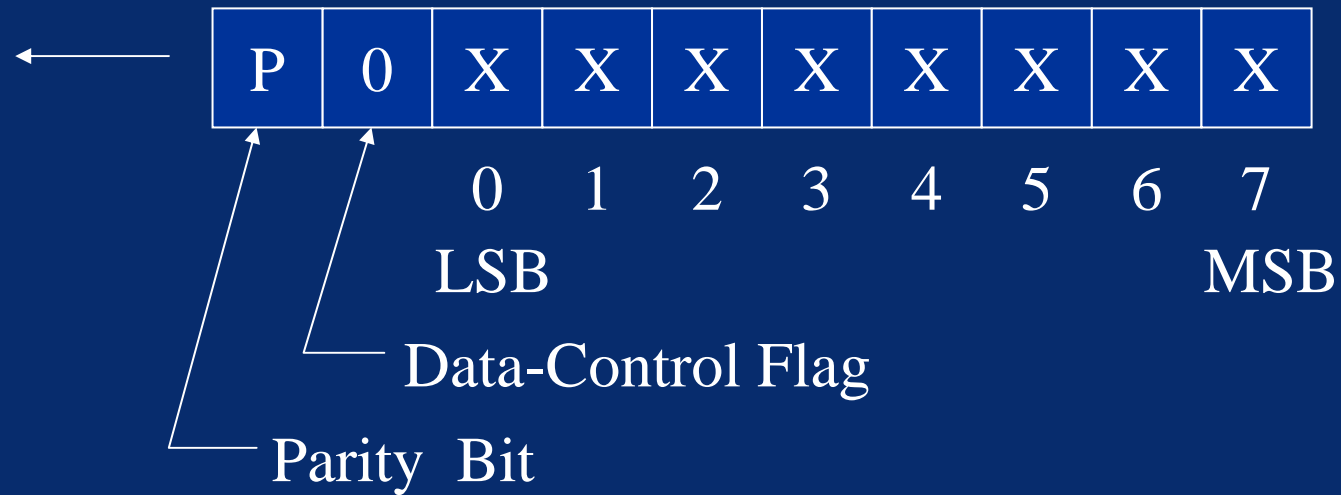

Space
Technology
Centre
University of Dundee

Character Level

- Character level defines
 - Data characters
 - Used to transfer data
 - Control characters
 - Used to manage flow of data across link
- Two types of character
 - L-char
 - Concerned with link operation
 - N-char
 - Used to carry data and delimit packets

Data Characters

Control Characters

| | | | | | | |
|---|---|---|---|---|-----|----------------------|
| ← | P | 1 | 0 | 0 | FCT | Flow Control Token |
| ← | P | 1 | 0 | 1 | EOP | Normal End of Packet |
| ← | P | 1 | 1 | 0 | EEP | Error End of Packet |
| ← | P | 1 | 1 | 1 | ESC | Escape |

Control Codes

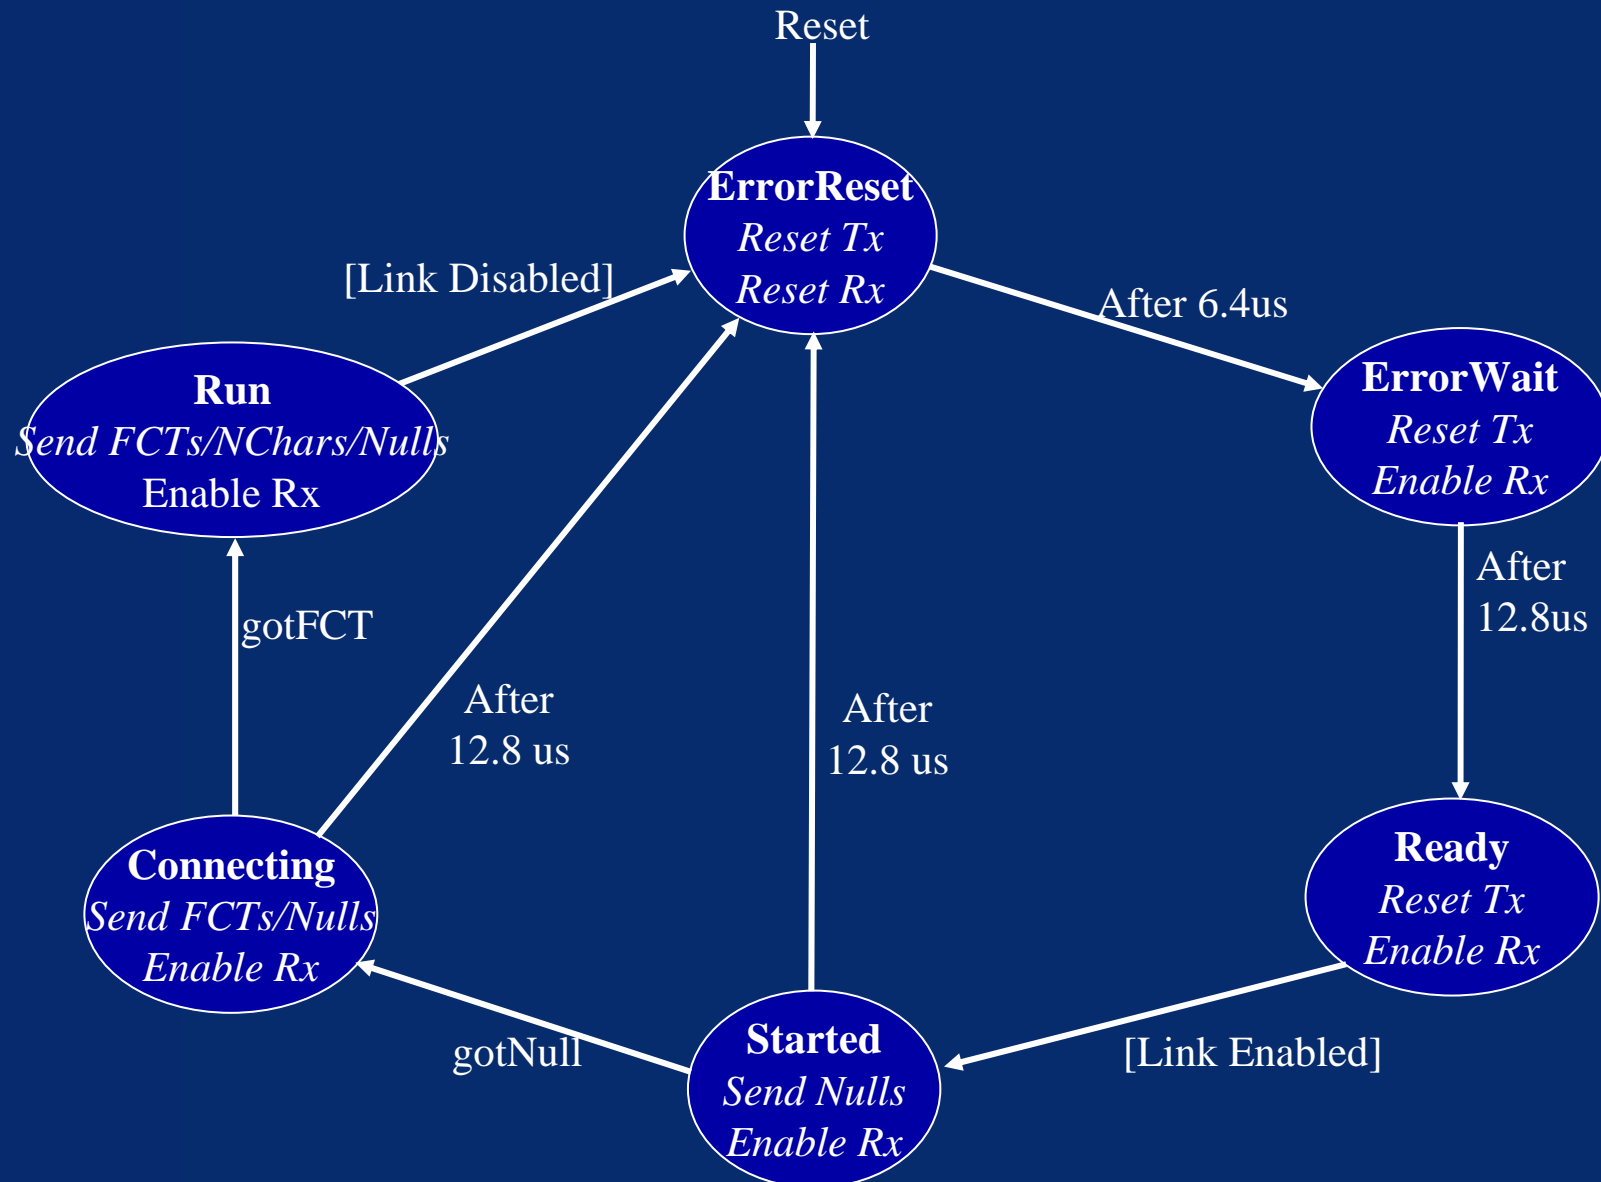

Space
Technology
Centre
University of Dundee

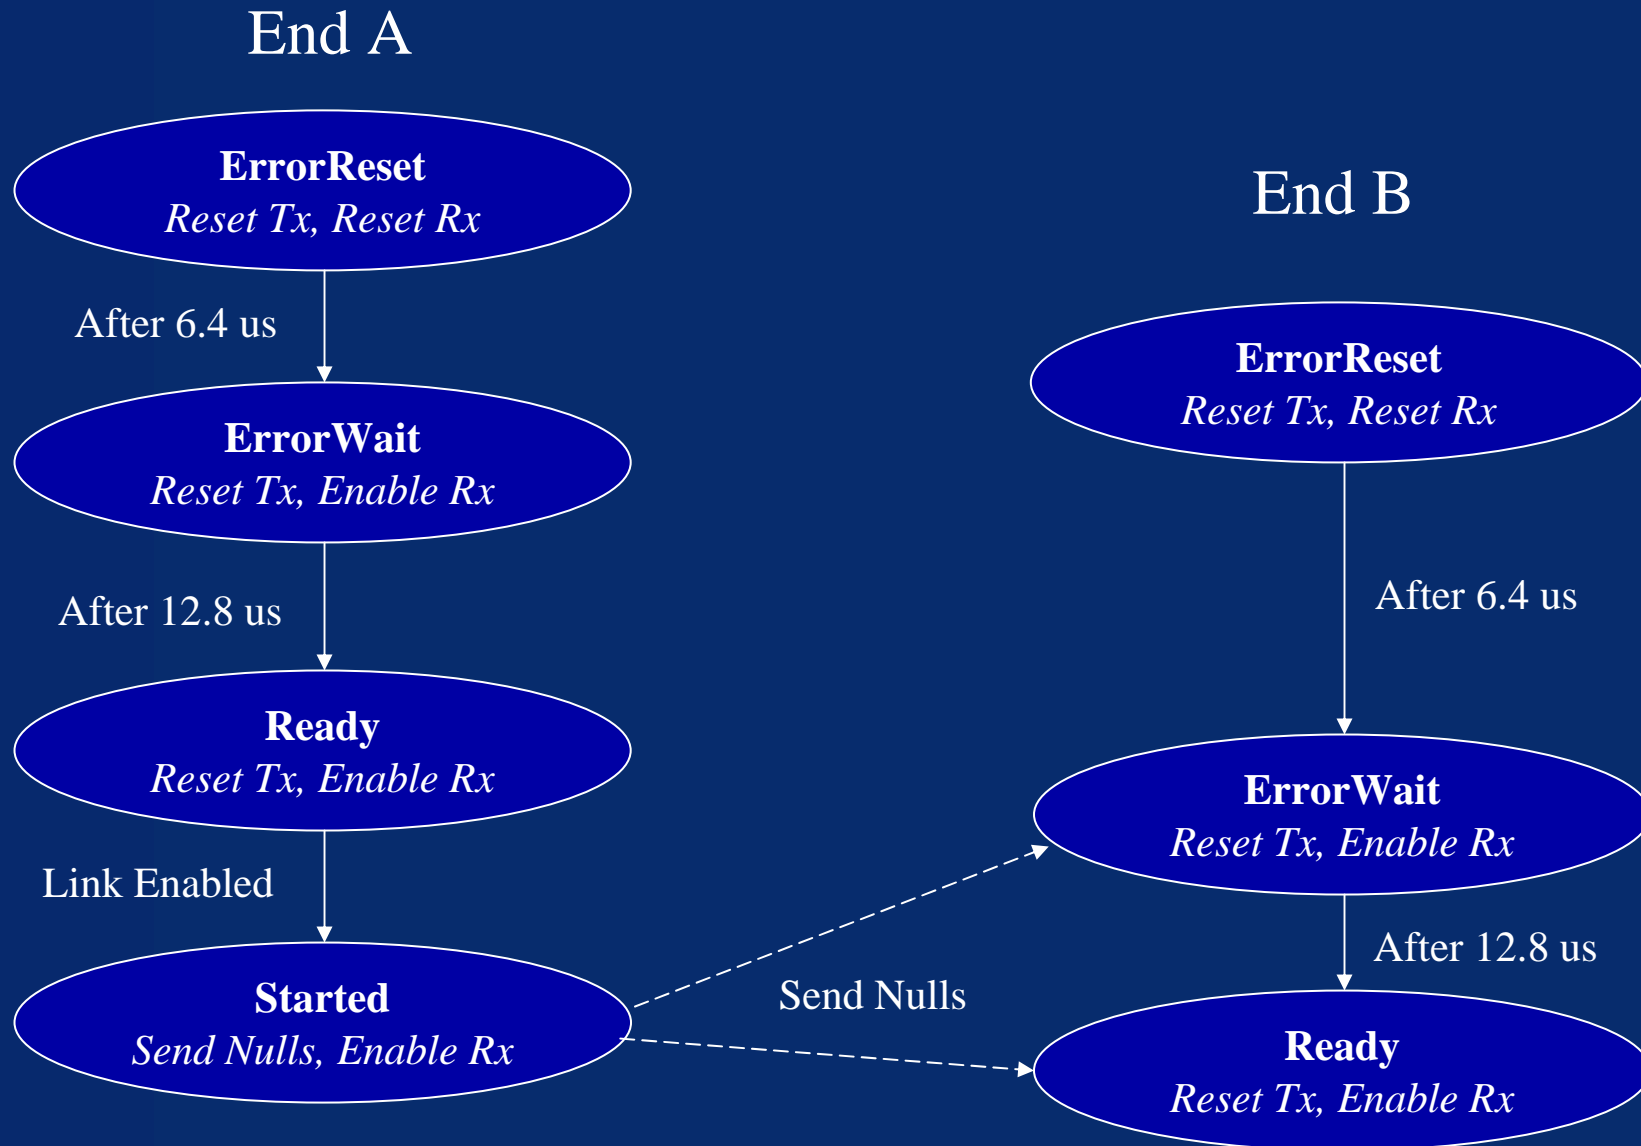

Exchange Level

- Exchange Level Protocol defines
 - Link initialisation
 - Flow control
 - Detection of link errors
 - Recovery from link errors

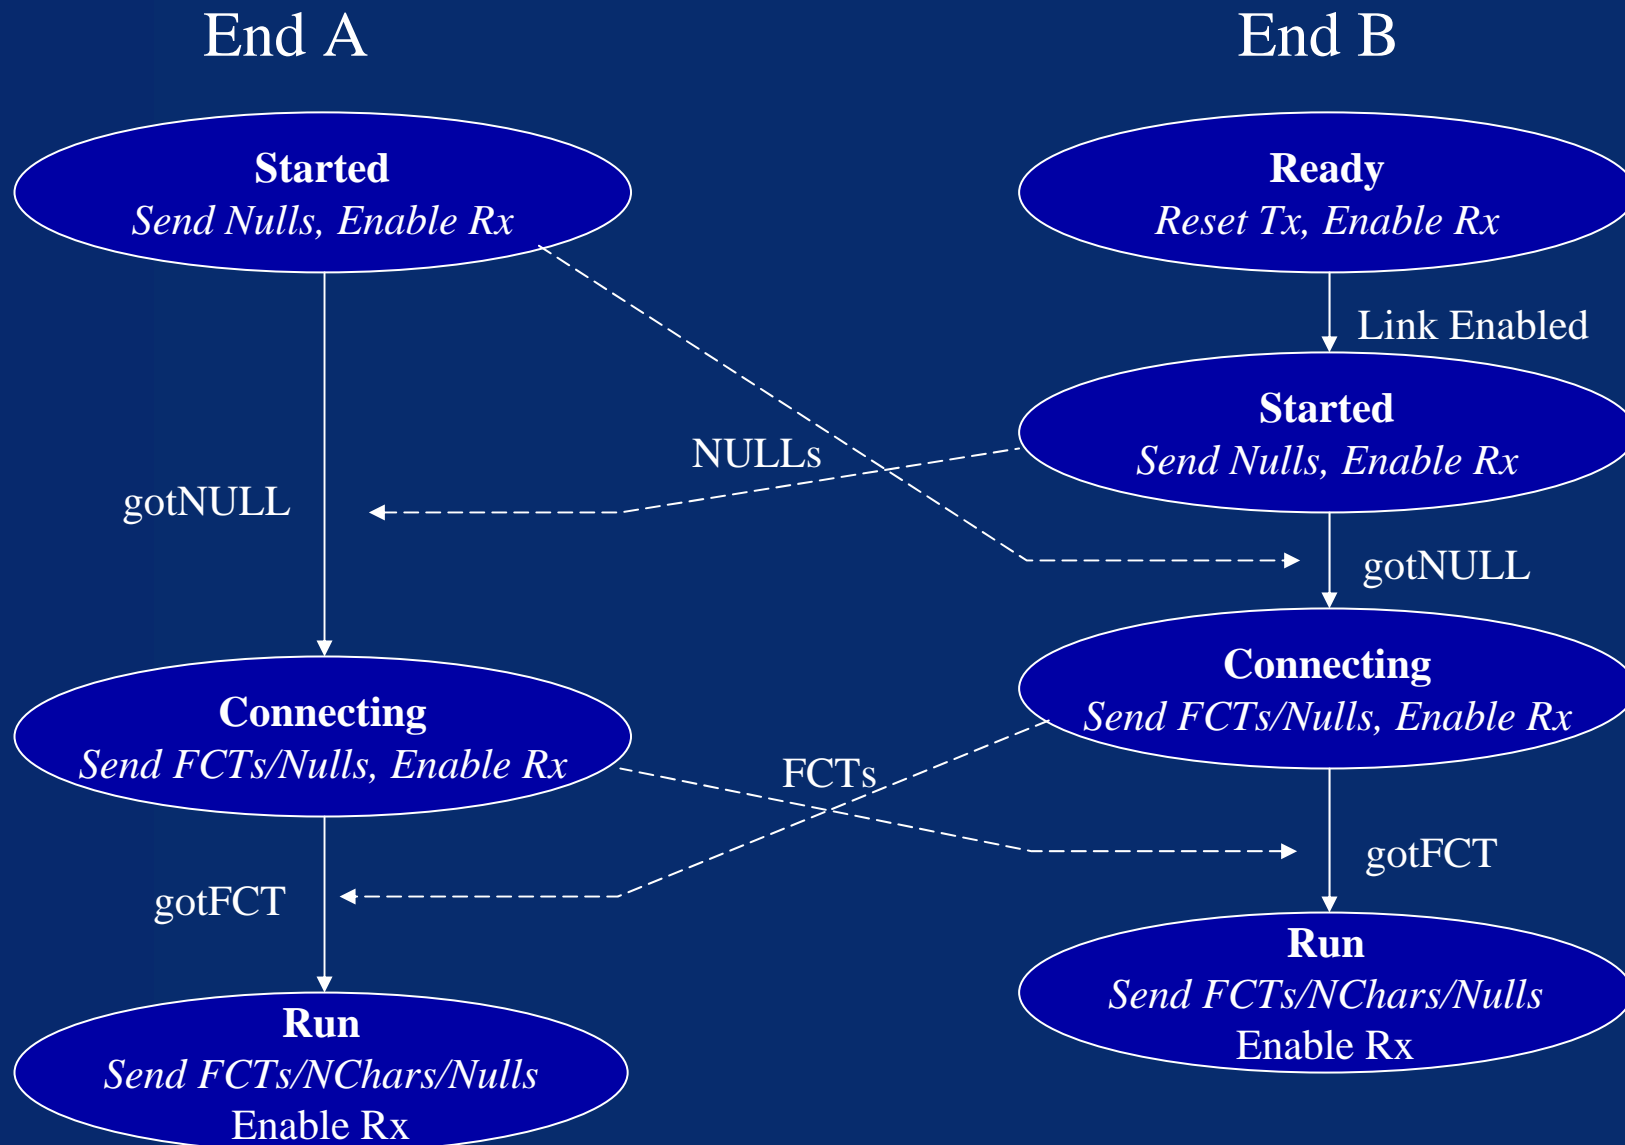

Basic State Machine

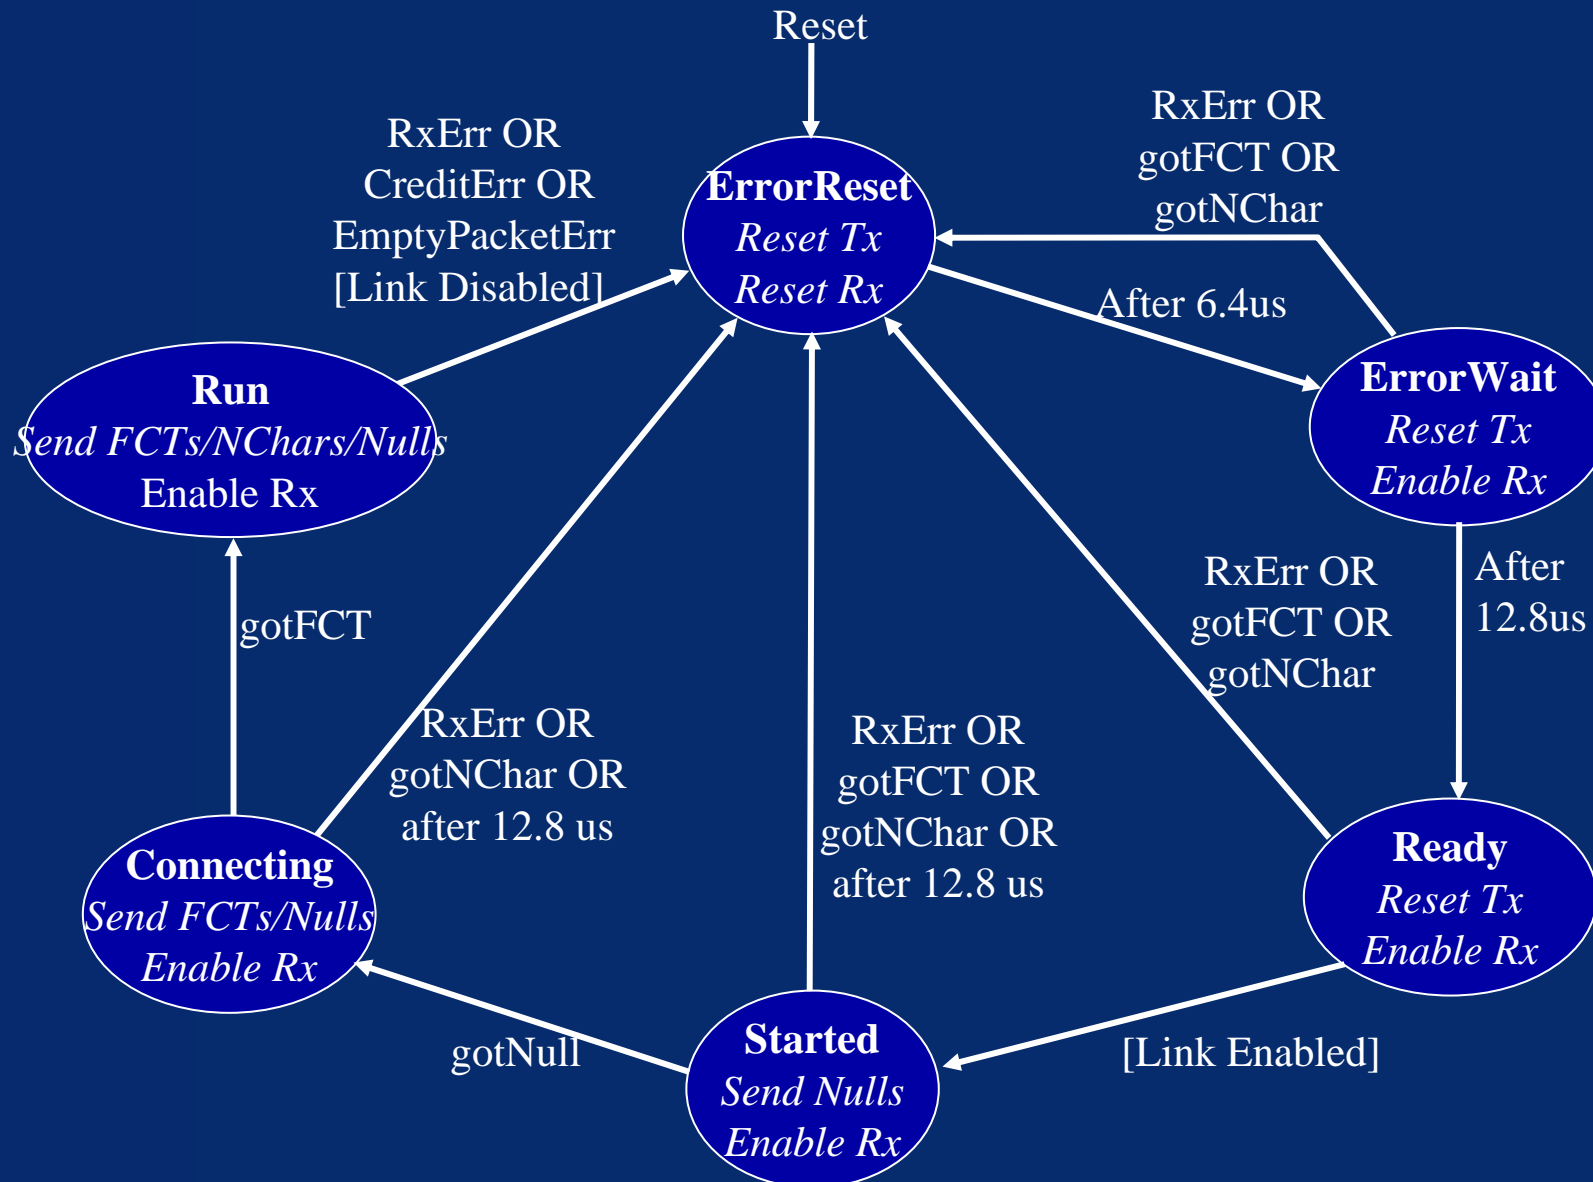

Link Initialisation (1)

Link Initialisation (2)

Full State Machine

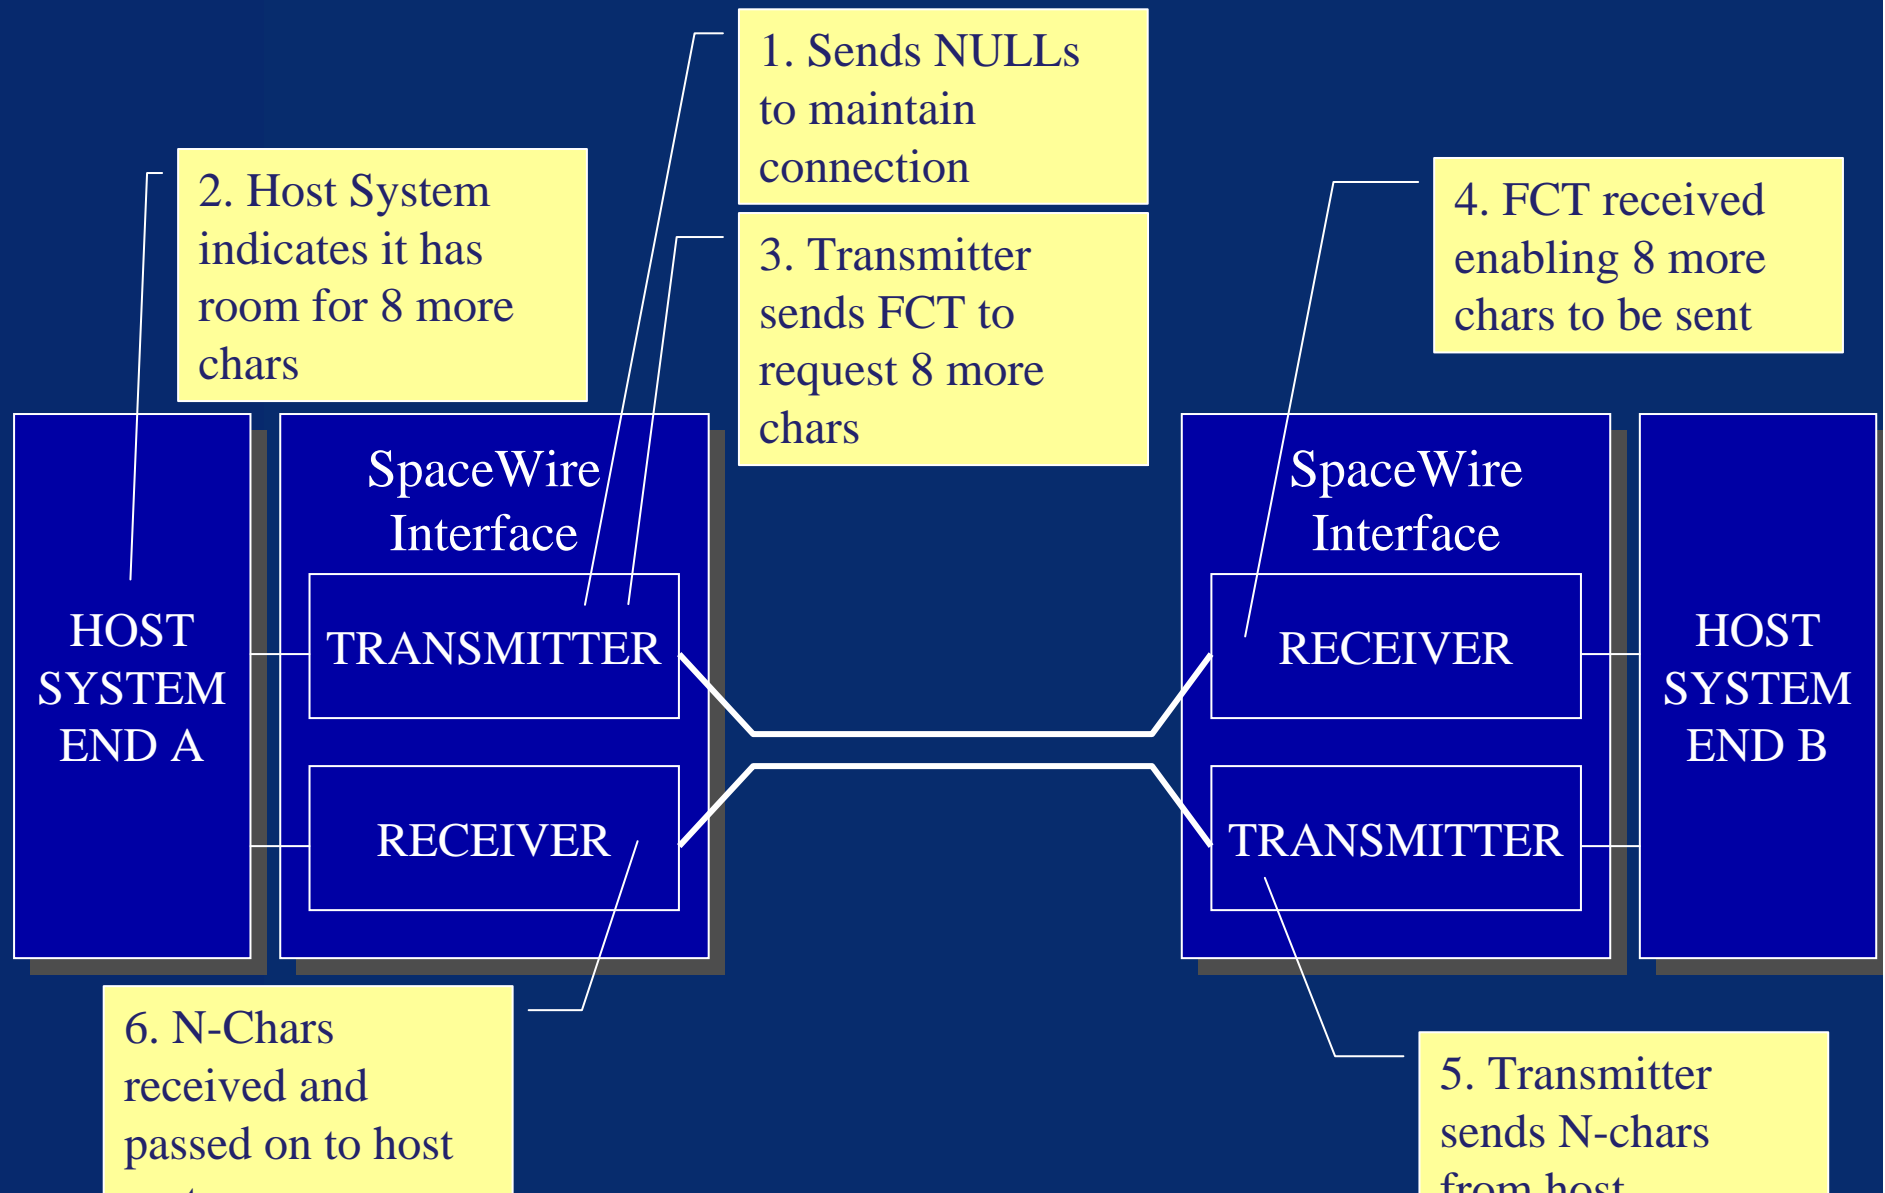

Space
Technology
Centre
University of Dundee

Flow Control

- Flow control used to avoid overflow of host receive buffer
 - Use flow control tokens (FCTs)
 - Send FCT from end A to end B
 - when end A can accept 8 more N-Chars.
 - This enables end B to send up to 8 more N-Chars.
 - Multiple FCTs can be sent if there is more room in buffer.
- FCT is exchanged for 8 N-Chars
- TX and RX must keep count of credit.

Normal Operation

Space
Technology
Centre
University of Dundee

Error Detection

- Disconnect Error
 - No RX clock transition for more than 850 ns
- Parity Error
 - Parity bit
- Escape Error
 - ESC should only be followed by
 - FCT to form a Null
 - Data to form a time-code
- Credit Error
 - If there is no room in host RX buffer for data received then an error must have occurred that affected the FCTs
- Empty Packet Error
 - EOP/EEP followed by another EOP/EEP

Space
Technology
Centre
University of Dundee

Packet Level

- Packet Level Protocol
 - Defines packet structure

Space
Technology
Centre
University of Dundee

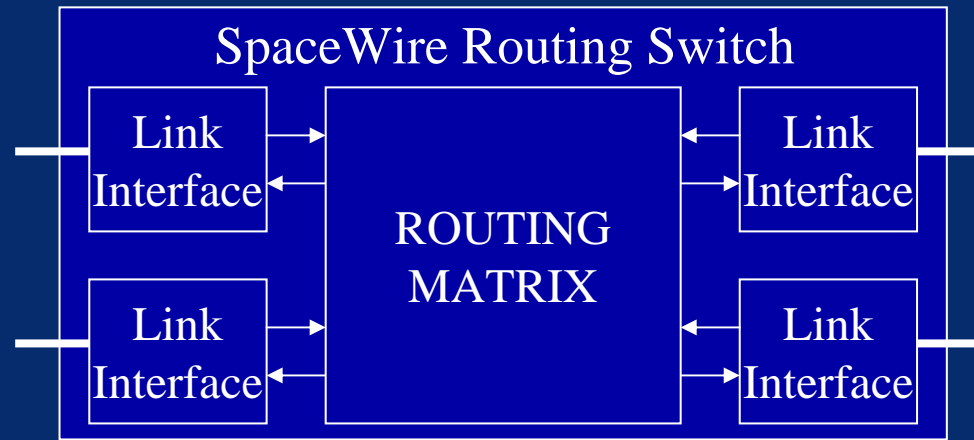

SpaceWire Packets

- Packet formal
 - `<DESTINATION><CARGO><EOP>`
- Destination
 - Represents path to or identity of destination node
- Cargo
 - Data or message to be transferred from source to destination
- EOP
 - Indicates end of packet

Space
Technology
Centre
University of Dundee

SpaceWire Routing Switches

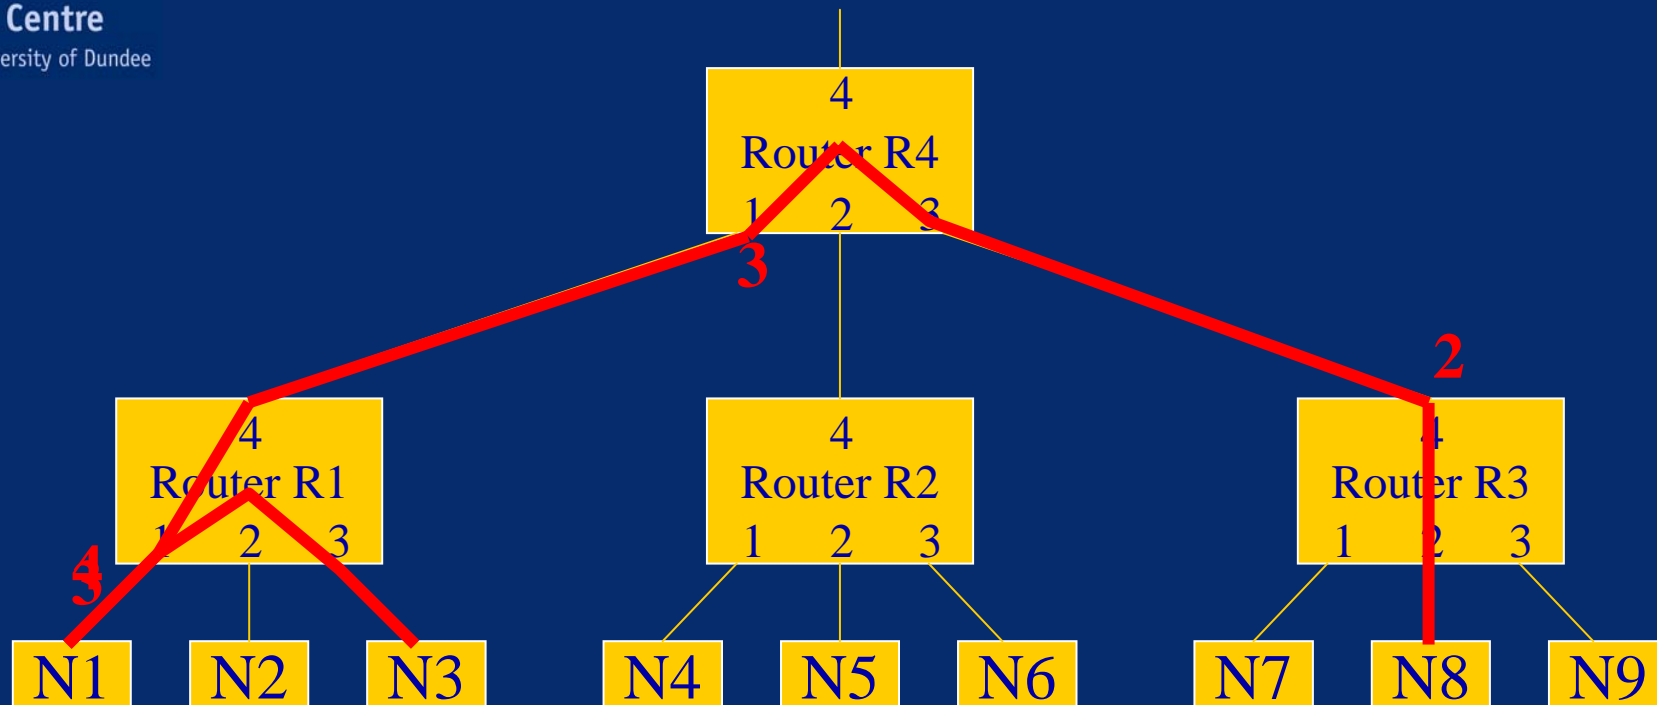

- Several link interfaces interconnected via a switching matrix.
- Wormhole routing.
- Path and Logical addressing.
- Priority addressing.
- Group adaptive routing.

Space
Technology
Centre
University of Dundee

Path Addressing

- Destination is specified as router output port number
- Node 1 to node 3 <3><cargo><EOP>
- Node 1 to node 8 <4><3><2><cargo><EOP>

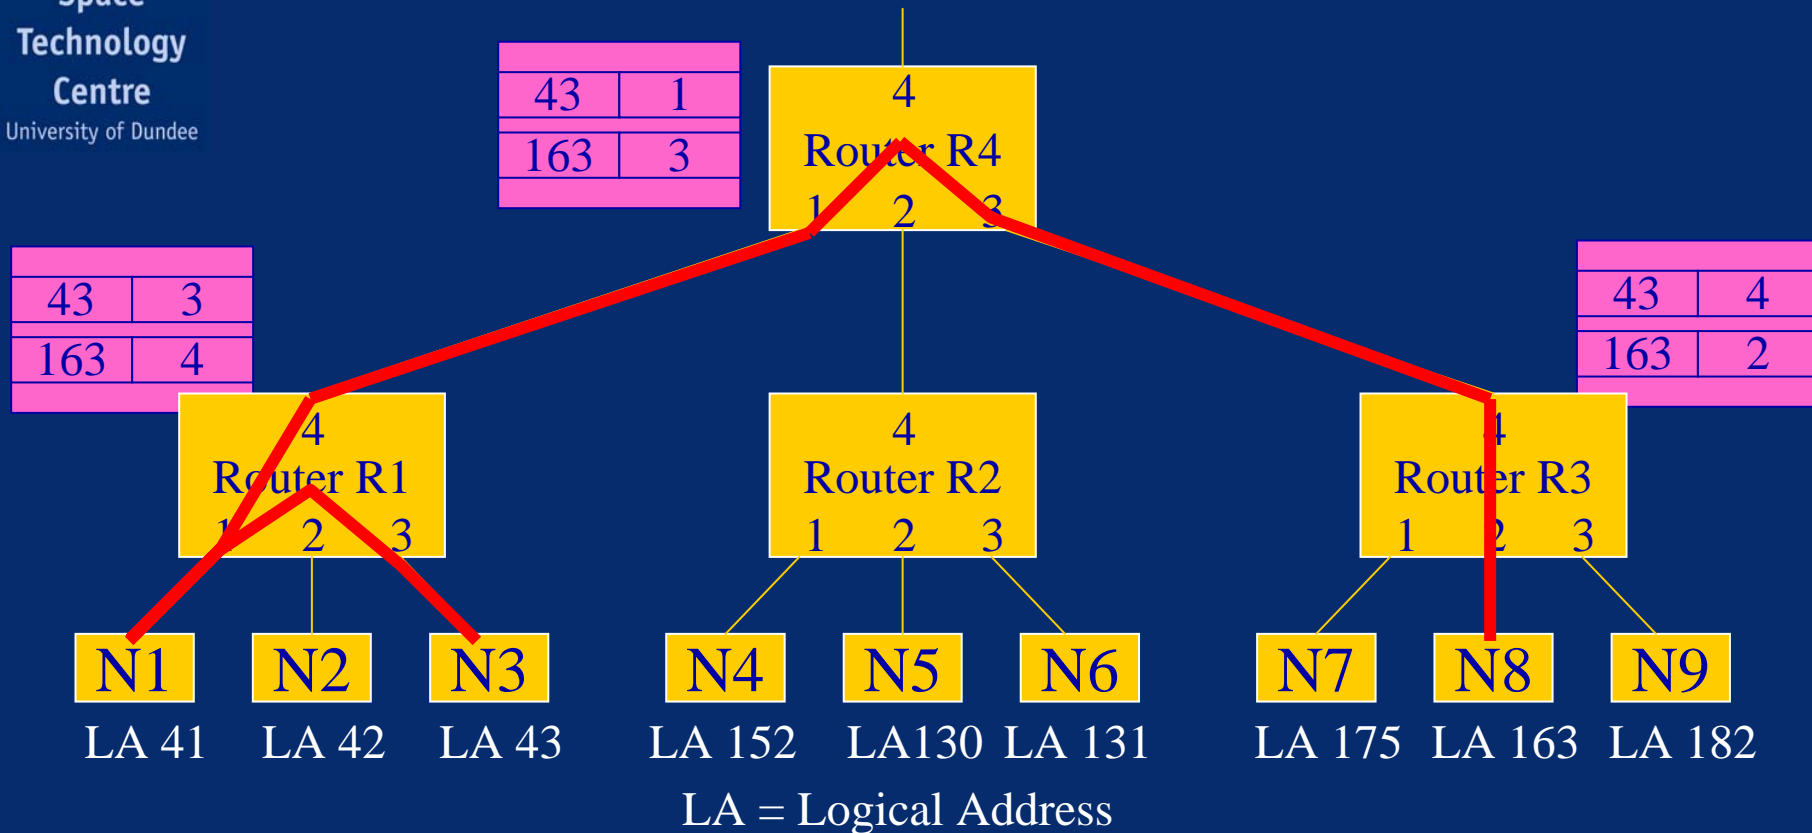

Space
Technology
Centre
University of Dundee

Logical Addressing

- Each destination has a unique logical address
- Each router has a list of which port(s) to send data out for each possible destination
- Node 1 to node with logical address 43 <43><cargo><EOP>
- Node 1 to node with logical address 163 <163><cargo><EOP>

Space
Technology
Centre
University of Dundee

Routing Table

| | Address | Port 0 | Port 1 | Port 2 | Port 3 | Port 4 |
|--------------------|---------|--------|--------|--------|--------|--------|
| Configuration | 0 | 1 | 0 | 0 | 0 | 0 |
| Path Addressing | 1 | 0 | 1 | 0 | 0 | 0 |
| | 2 | 0 | 0 | 1 | 0 | 0 |
| | ... | | | | | |
| Logical Addressing | 32 | 0 | 1 | 0 | 0 | 0 |
| | 33 | 0 | 0 | 1 | 0 | 0 |
| | 34 | 0 | 0 | 0 | 0 | 1 |
| | ... | | | | | |
| Reserved | 255 | 0 | 0 | 0 | 0 | 0 |

Space
Technology
Centre
University of Dundee

Priority

- Arbitration in Router
 - Fair arbitration
 - Priority based
- SpaceWire header contains address only
- Assign priority to logical addresses

Space
Technology
Centre
University of Dundee

Priority

| | Address | Priority | Port 0 | Port 1 | Port 2 | Port 3 | Port 4 |
|--------------------|---------|----------|--------|--------|--------|--------|--------|
| Configuration | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| Path Addressing | 1 | 0 | 0 | 1 | 0 | 0 | 0 |
| | 2 | 0 | 0 | 0 | 1 | 0 | 0 |
| | ... | | | | | | |
| Logical Addressing | 32 | 0 | 0 | 1 | 0 | 0 | 0 |
| | 33 | 1 | 0 | 1 | 0 | 0 | 0 |
| | 34 | 0 | 0 | 0 | 0 | 0 | 1 |
| | ... | | | | | | |
| Reserved | 255 | 0 | 0 | 0 | 0 | 0 | 0 |

Space
Technology
Centre
University of Dundee

Group Adaptive Routing

- Node B to Node E can use any of three possible links between router X and router Y
- Shares available bandwidth
- Provides support for fault tolerance

Space
Technology
Centre
University of Dundee

Group Adaptive Routing

| | Address | Priority | Port 0 | Port 1 | Port 2 | Port 3 | Port 4 |
|--------------------|---------|----------|--------|--------|--------|--------|--------|
| Configuration | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| Path Addressing | 1 | 0 | 0 | 1 | 0 | 0 | 0 |
| | 2 | 0 | 0 | 0 | 1 | 0 | 0 |
| | ... | | | | | | |
| Logical Addressing | 32 | 0 | 0 | 1 | 1 | 0 | 0 |
| | 33 | 1 | 0 | 1 | 1 | 0 | 0 |
| | 34 | 0 | 0 | 0 | 0 | 1 | 1 |
| | ... | | | | | | |
| Reserved | 255 | 0 | 0 | 0 | 0 | 0 | 0 |

University of Dundee

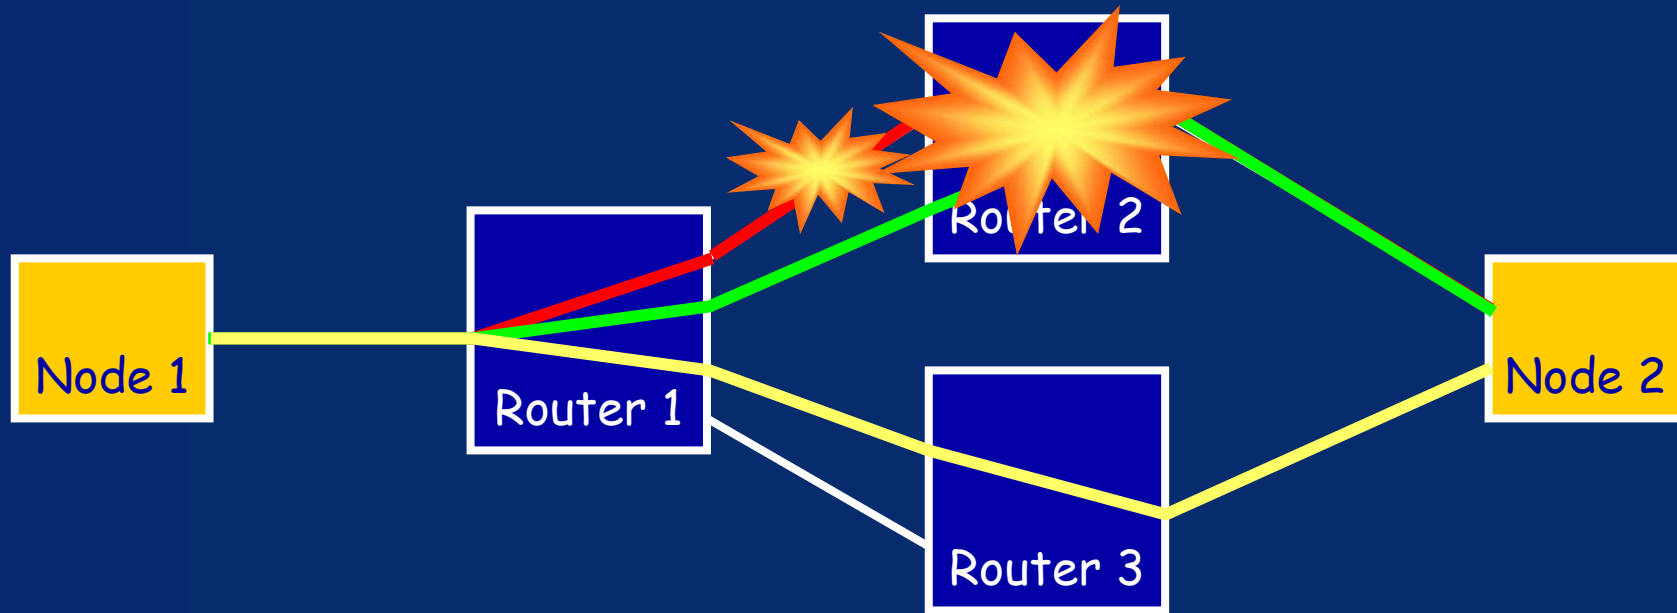

SpaceWire Network

- Two or more SpaceWire nodes
- Zero or more SpaceWire routing switches
- Interconnected with SpaceWire links

- Add bandwidth where required
- Add redundant links where required

Fault Tolerant Network

Space
Technology
Centre
University of Dundee

Time-codes

- Low latency broadcast of time information
- 6-bit time-value
- 2 flag bits
- Can be used for:
 - Time distribution
 - Event signalling
 - Isochronous communications

Space
Technology
Centre
University of Dundee

Nodes and Routers

- Each node or router has a 6-bit time counter
- Link interfaces have TICK_IN and TICK_OUT signals
- Asserting TICK_IN causes
 - Time counter to be incremented
 - New time-code to be transmitted
 - With value of time counter
- TICK_IN used by only one, time-master node
- When valid time-code received
 - Time counter is incremented
 - TICK_OUT is asserted

Space
Technology
Centre
University of Dundee

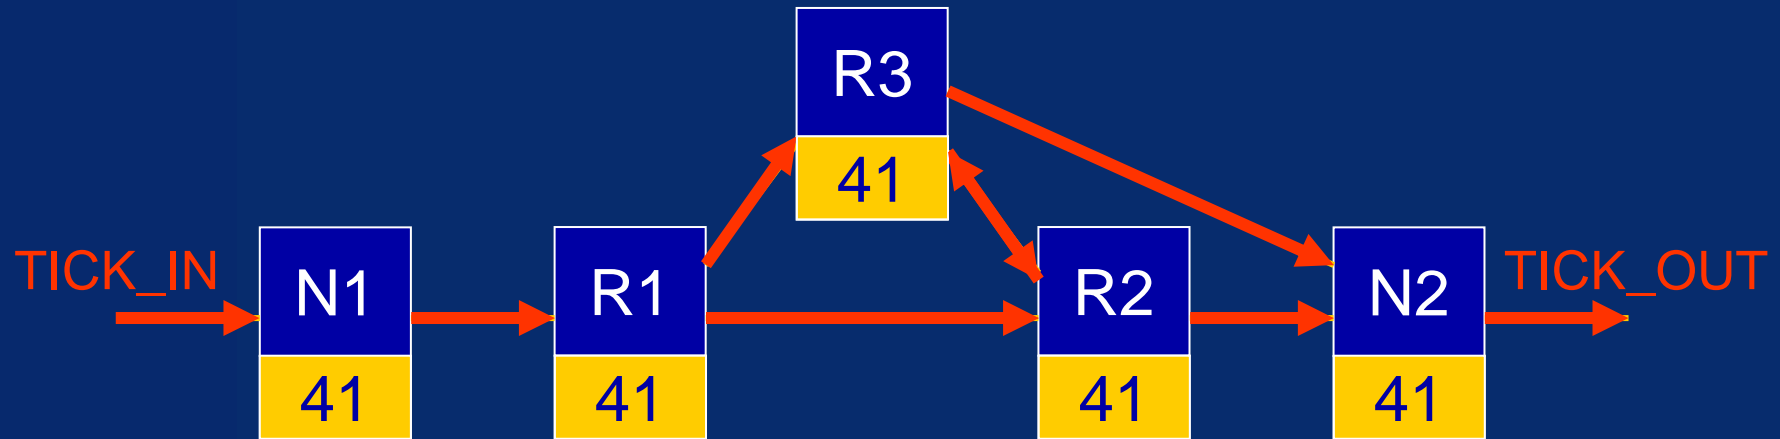

Nodes and Routers

- Valid time-codes have
 - Value of one more than time-counter
 - At the receiver
- If valid
 - Set time counter to new time-code value
 - Propagate time-code
- IF NOT valid
 - Set time counter to new time-code value
 - Do NOT propagate time-code

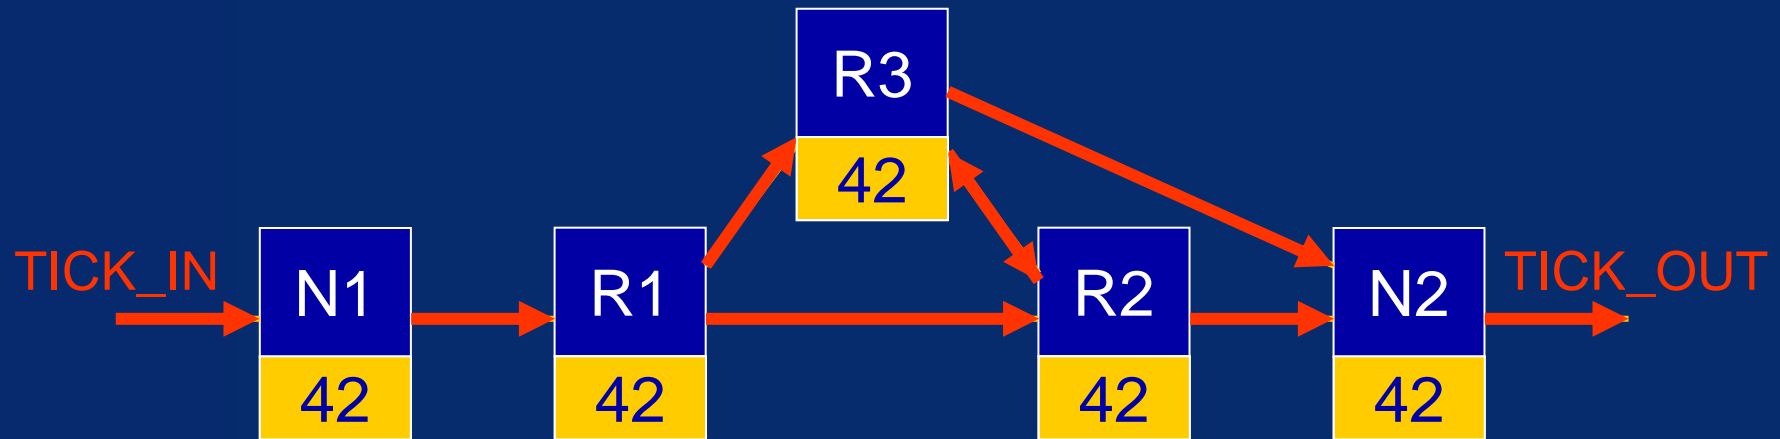

Time Distribution

Time Distribution

Time Distribution

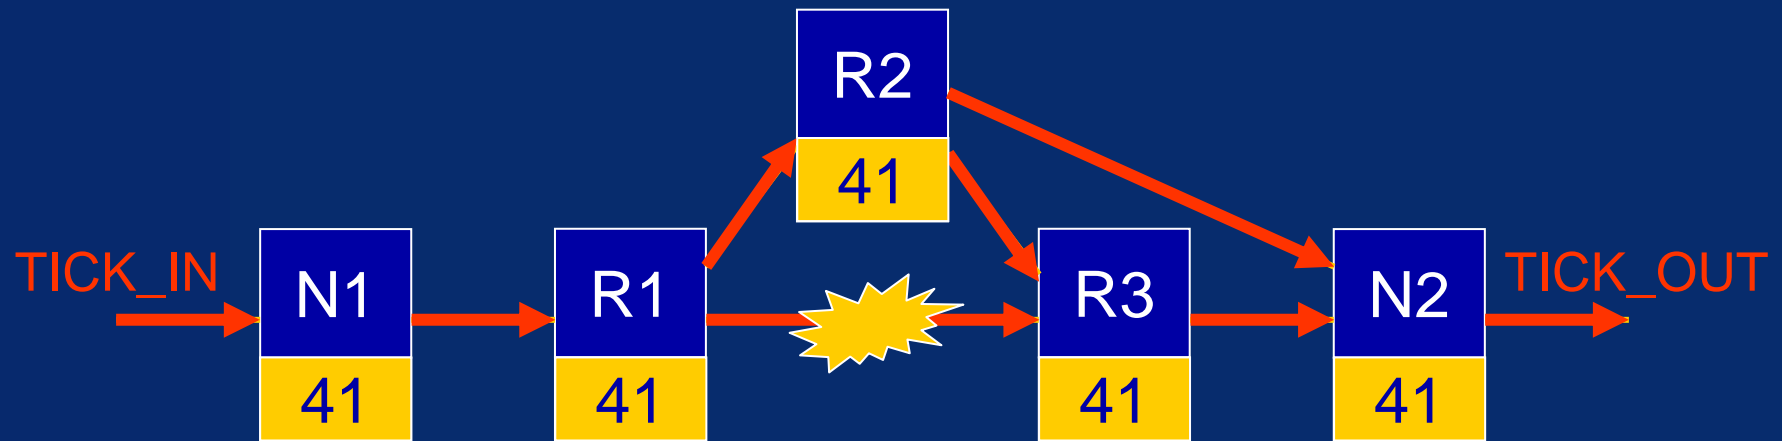

Time Distribution Error

Time Distribution Error

Time Distribution Error

Space
Technology
Centre
University of Dundee

Time-Code Latency

- Latency depends on
 - Number of links over which time-code travels
 - Operating rate of the links
 - Delay at time-code source
 - Delay at each router
 - Delay at each receiving node

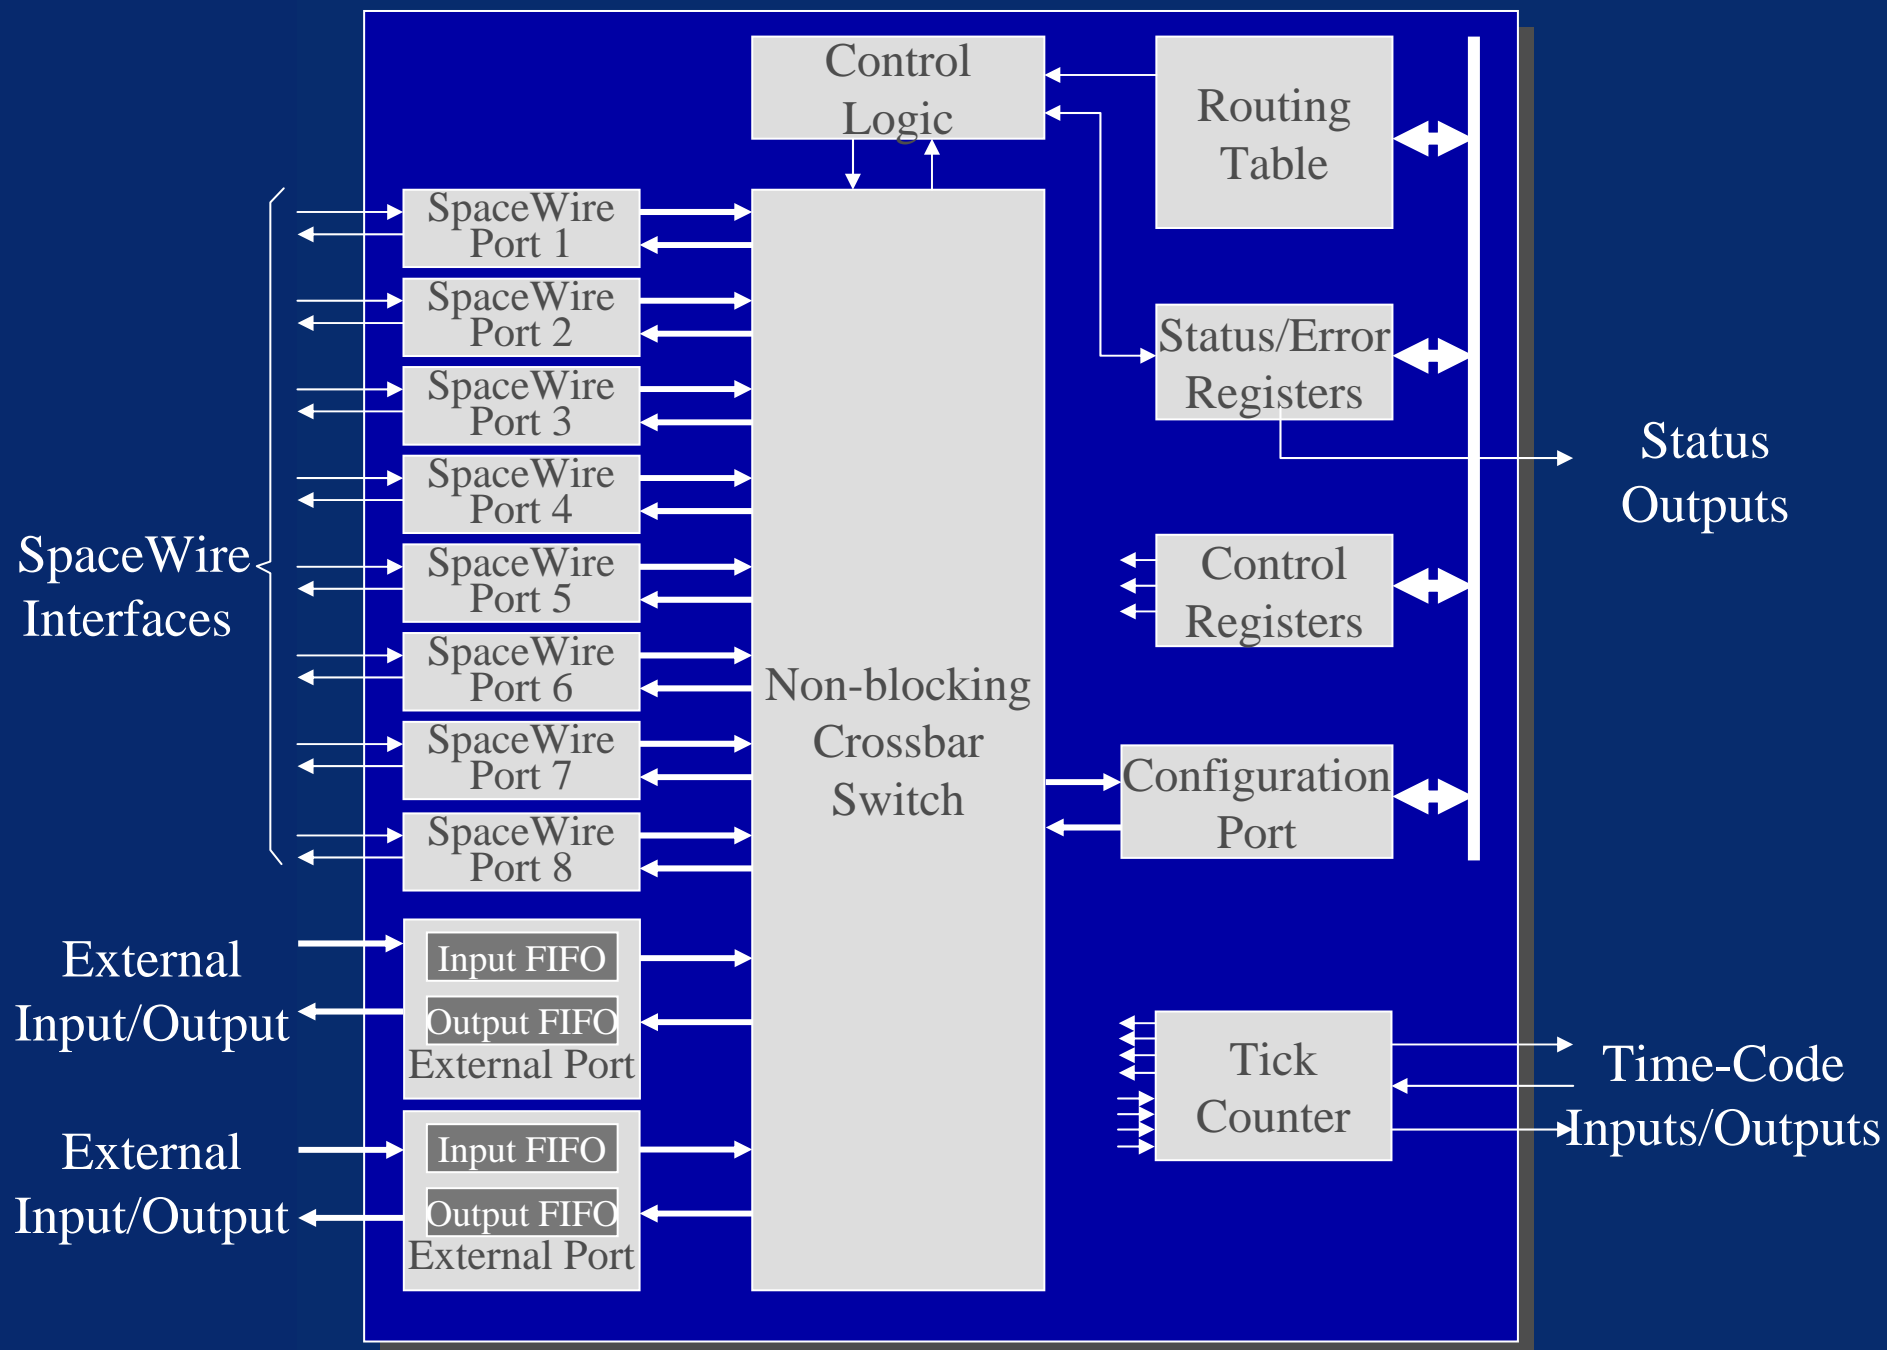

SpaceWire IP

- SpaceWire CODEC
 - Configurable VHDL core
 - Suitable for ASIC and FPGA implementation
 - Developed University of Dundee
 - Distributed by ESA for European space projects
 - Available from UoD for other applications
- SpaceWire Routing Switch
 - Configurable VHDL Router
 - Generics for
 - Number for SpaceWire Ports
 - Number of External Ports
 - Developed by University of Dundee
 - Available from UoD under licence

SpaceWire Devices

- Radiation tolerant FPGA implementations
- SMCS332SpW
 - 3 SpaceWire ports
 - Interface to processor and memory
- SMCSLiteSpW
 - 1 SpaceWire port
 - Interface to peripherals
 - E.g. DAC, ADC, FIFO, UART, GPIO
- Remote Terminal Computer
 - LEON SPARC processor
 - With SpaceWire and CAN bus interfaces
- SpaceWire Router

Space
Technology
Centre
University of Dundee

Router ASIC Technology

- ASIC
 - Implementation in Atmel MHR1RT gate array
 - Max gate count 519 kgates (typical)
 - 0.35 μm CMOS process
- Radiation tolerance
 - Up to 300 krad
 - SEU free cells to 100 MeV
 - Used for all critical memory cells
 - Latch-up immunity to 100 MeV

Space
Technology
Centre
University of Dundee

Router ASIC Performance

- Performance
 - SpaceWire interface 200 Mbits/s
 - Low latency $< 1\mu\text{s}$
 - LVDS drivers/receivers integrated on chip
- Power
 - 4 W power with all links at maximum data rate
 - Single 3.3 V supply
 - Power saving modes
- Package
 - 196 pin ceramic Quad Flat Pack 25 mil spacing

SpaceWire Key Features

- Serial, bi-directional, full duplex
- High data rate (> 200 Mbits/s)
- Distance of 10 m +
- Low gate count
- Can be implemented in FPGAs
- Scalable
- Low error rate
- Good EMC performance
- Fault tolerant support
- Radiation tolerant components

Space
Technology
Centre
University of Dundee

Higher-Level Protocols

- Remote Memory Access Protocol
- SMCS Configuration Protocol
- CCSDS SOIS Protocol

SpaceWire Protocol Identifier

Logical Address with Protocol ID

Path Address with Protocol ID

Space
Technology
Centre
University of Dundee

RMAP

- Remote Memory Access Protocol
- Provides a means of
 - Writing to
 - Reading from
 - Registers or memory on a SpaceWire node
 - Registers are considered to be memory-mapped
- Simple
- Flexible
- Encompasses diverse applications

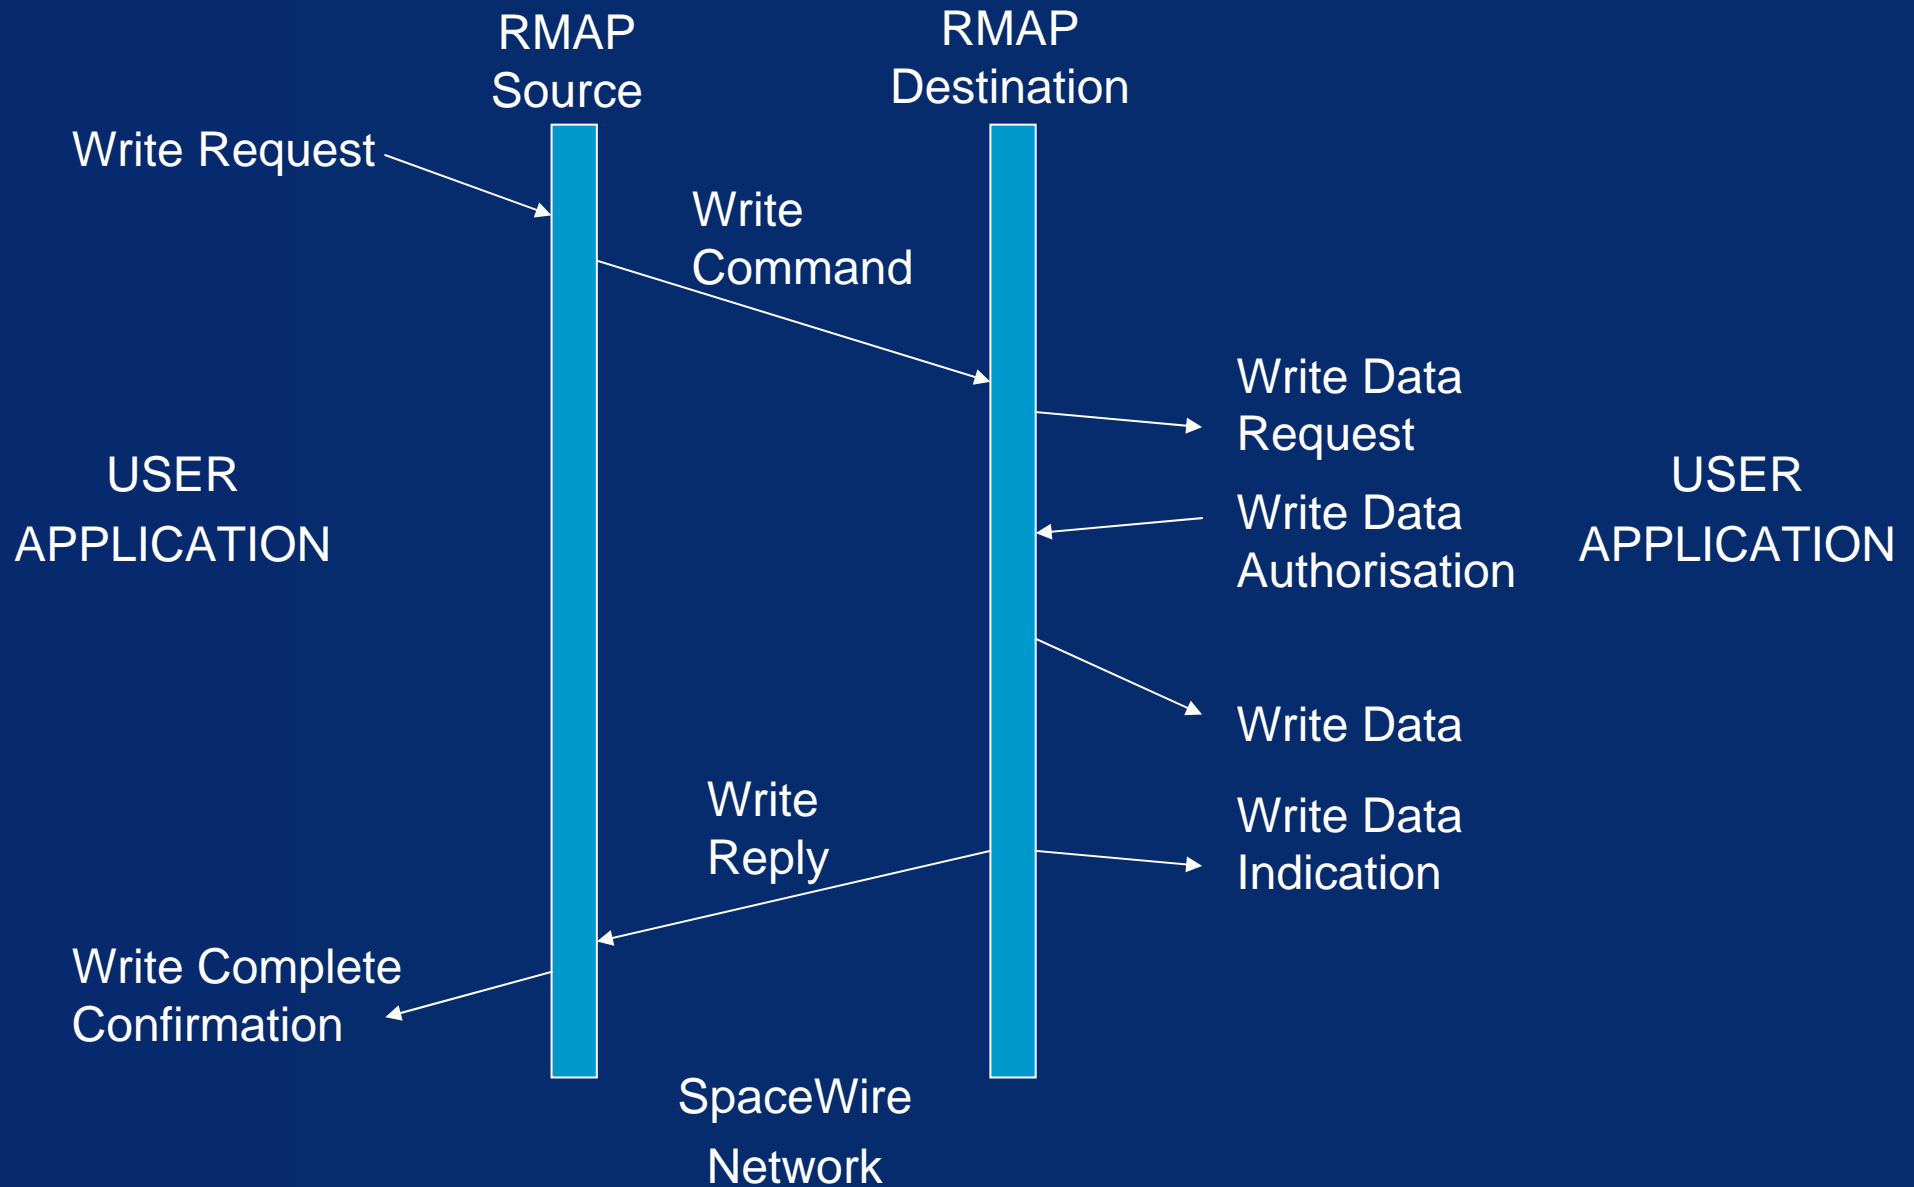

Write Command

First byte transmitted

| | | | |
|---------------------------|------------------------|---|------------------------|
| Destination Logical Addr. | Protocol Identifier | Packet Type, Command, Source Path Addr Len | Destination Key |
| Source Logical Address | Transaction Identifier | Transaction Identifier | Extended Write Address |
| Write Address (MS) | Write Address | Write Address | Write Address (LS) |
| Data Length (MS) | Data Length | Data Length (LS) | Header CRC |
| Data | Data | Data | Data |
| Data | Data | Data | Data |
| Data | Data CRC | EOP | |

Last byte transmitted

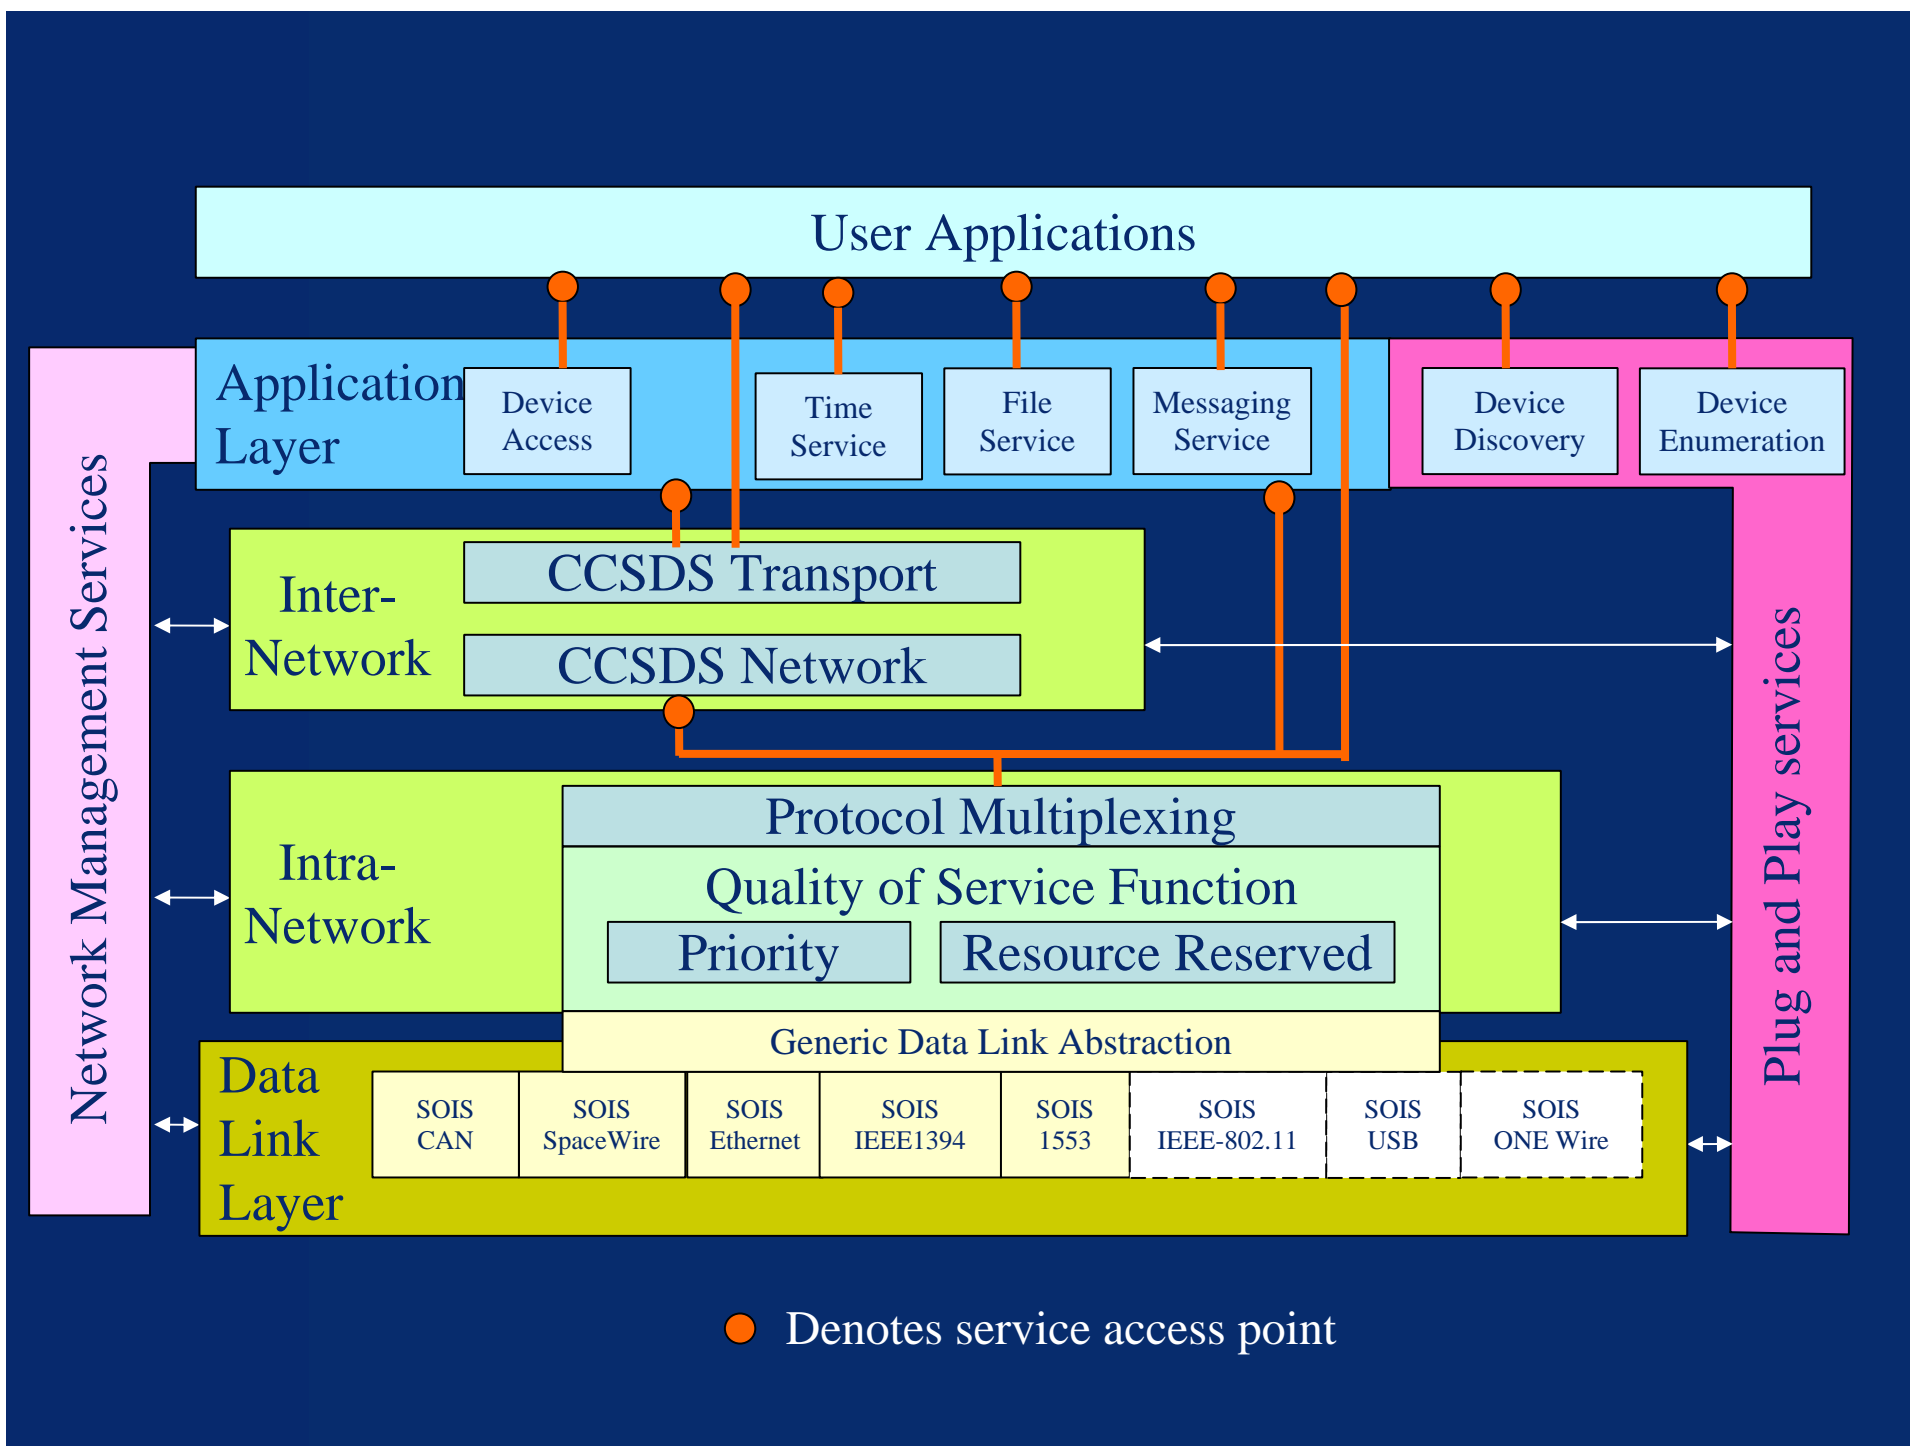

Write Operation

CCSDS SOIS

- Architecture that provides:
 - Uniform interface for communicating over various underlying buses
 - Scheduled
 - Asynchronous
 - Comprehensive QoS for onboard applications
 - Priority
 - Reserved / non-reserved
 - Retry / try once
 - Can be implemented in many different ways
 - Can make use of features of underlying buses
 - E.g. retry mechanism of IEEE1394
 - E.g. group adaptive routing of SpaceWire

Space
Technology
Centre
University of Dundee

Conclusion

- SpaceWire designed specifically for space applications
 - Low gate count
 - Low power
 - High performance
 - Standard
- IP cores available
- Devices
- Higher-level protocols
